INTRODUCTION

- As social media usage continues to increase in popularity, so do instances of cyberbullying (Kennedy, 2019; Chen et al., 2022).
- Individuals who identify as LGBTQ+ experience disproportionately high levels of cyberbullying and online toxicity compared to individuals who do not identify as a gender or sexual minority (Vaillancourt et al., 2021; Morales-Arjona, 2022).
- LGBTQ+ youth and adults face increased risk for mental health concerns, including suicidality (Ormiston & Williams, 2021; Ploderl & Tremblay, 2015).
- Research that seeks to identify and mitigate online toxicity toward LGBTQ+ individuals is thus timely, critical, and potentially lifesaving.

CURRENT STUDY

- The aim of this study is to gain insight into platform-based differences and more nuanced aspects of online toxicity targeting LGBTQ+ social media users.
- The study presents mixed methods findings from a sample of LGBTQ+ young adults who use social media.
- These findings incorporate quantitative self-report survey data with qualitative content analysis of open-ended responses.

METHOD

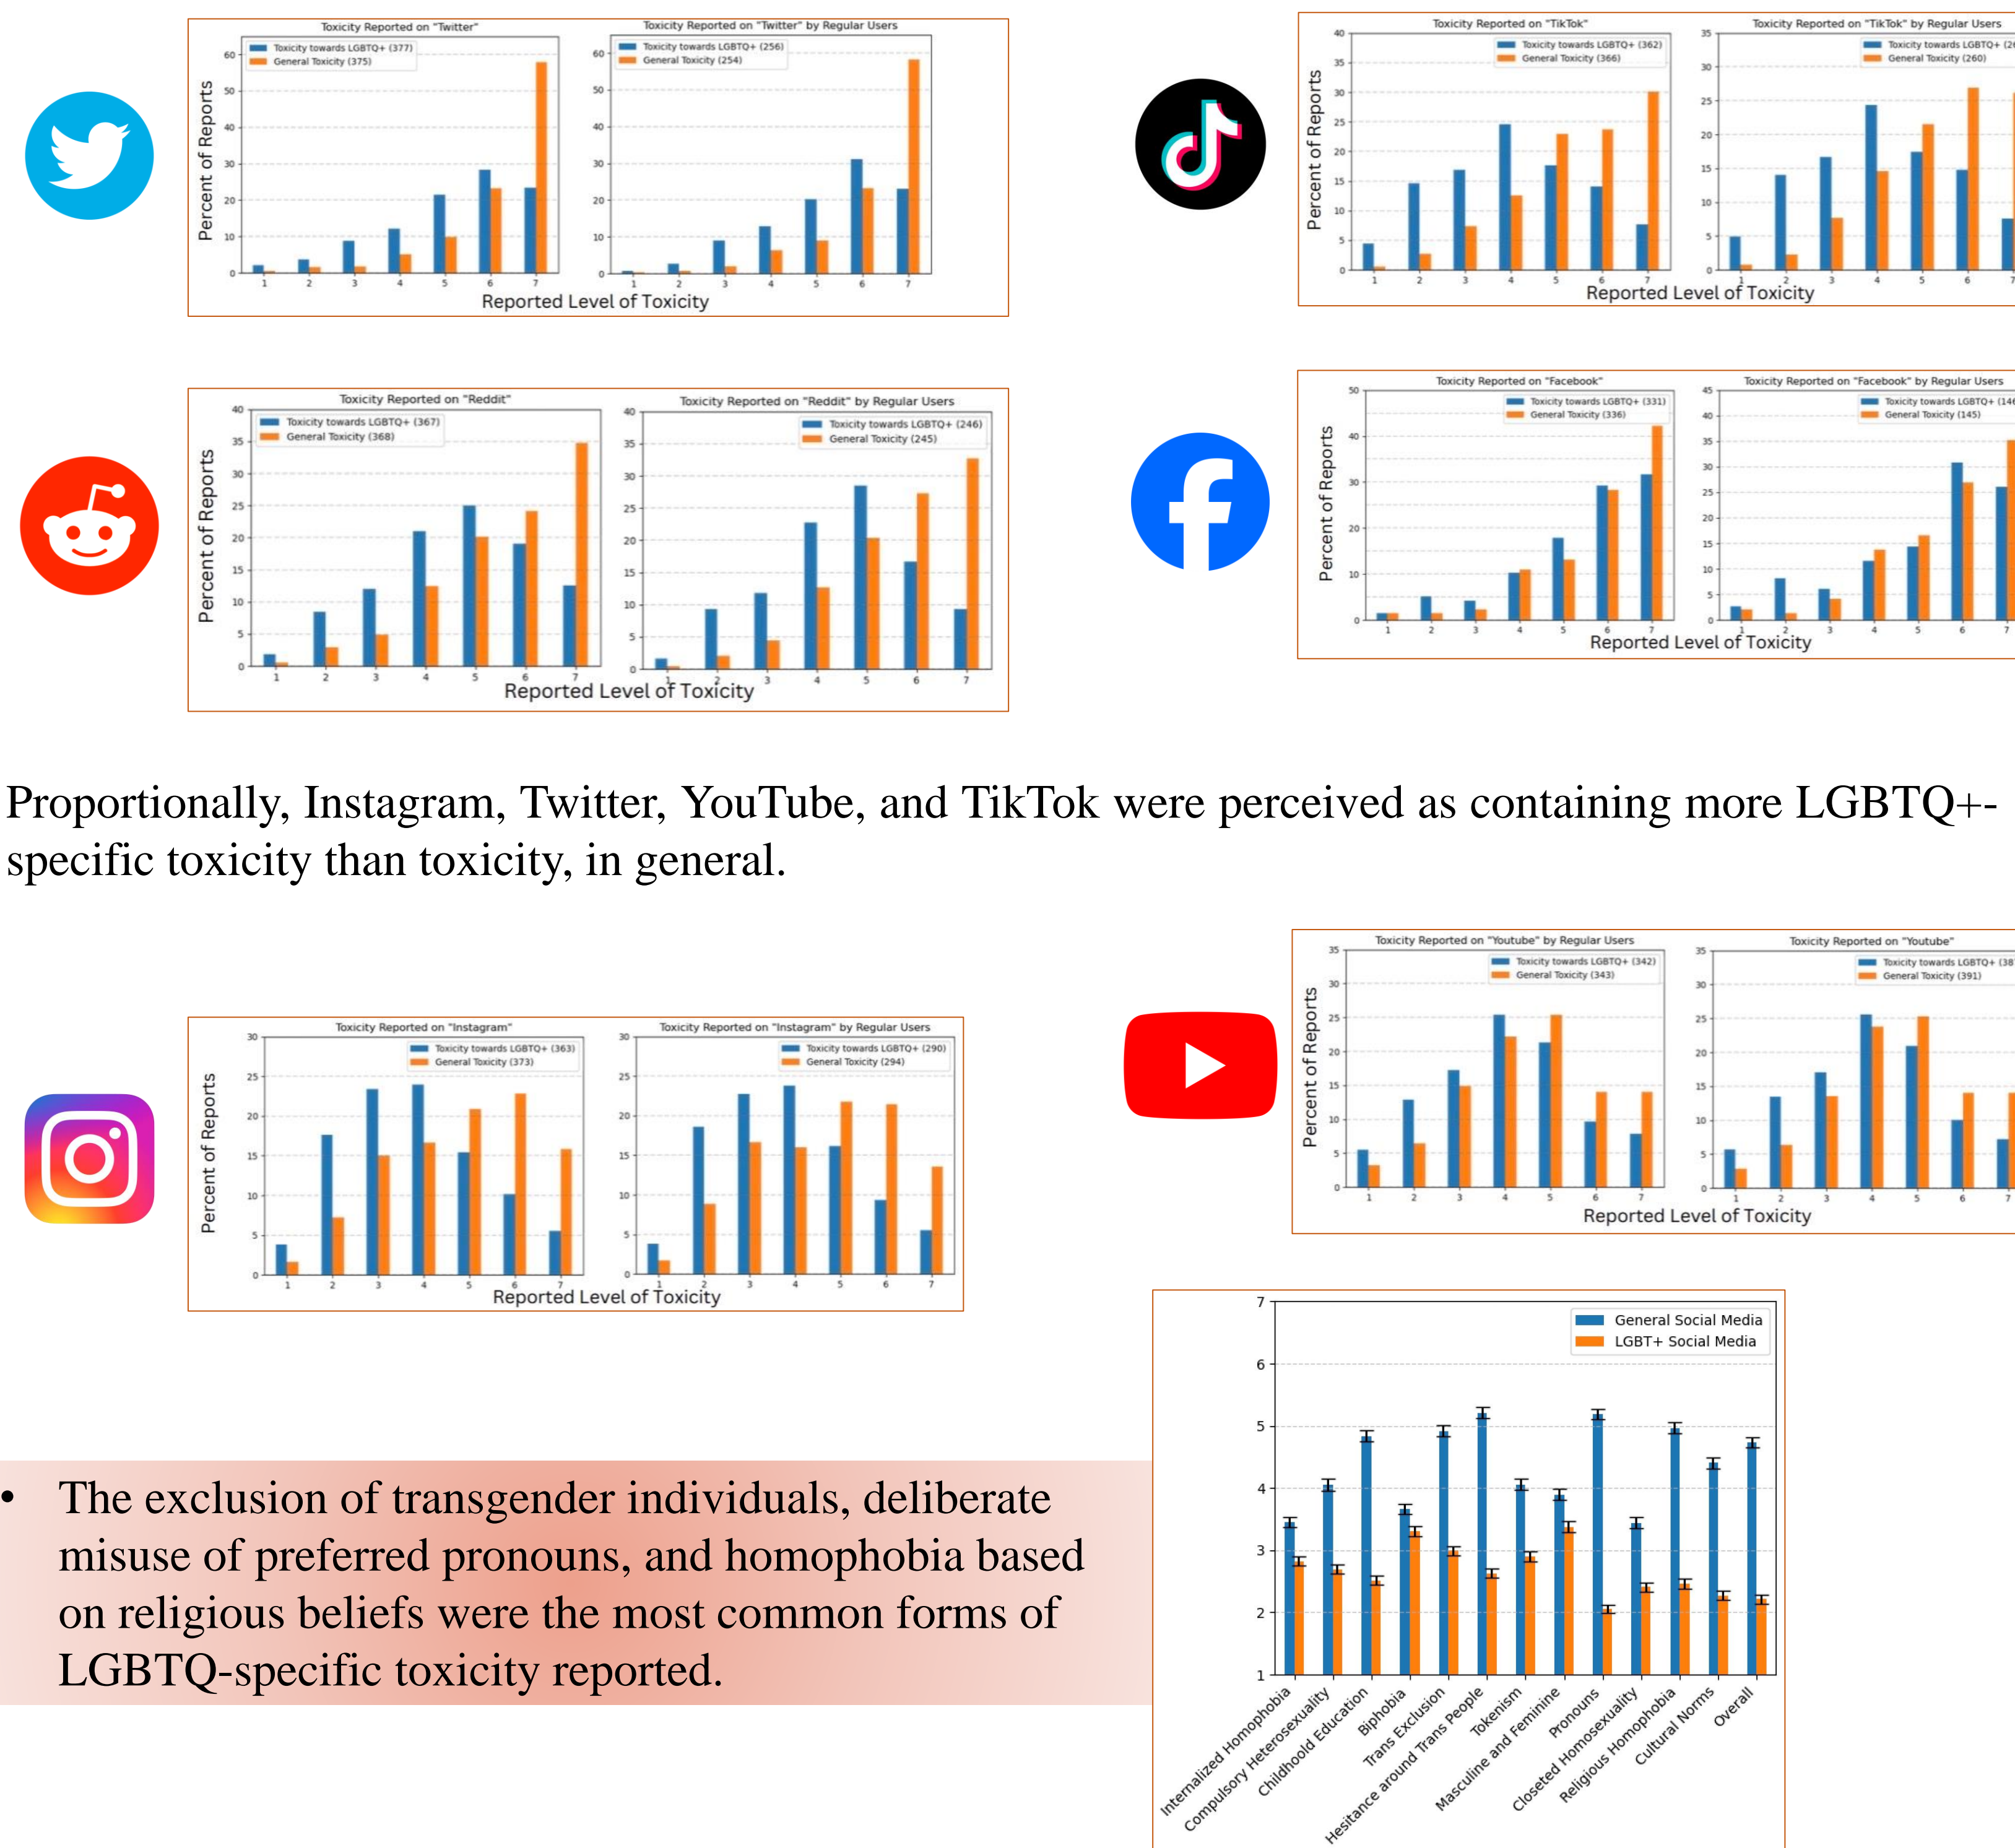

- Participants:** Young adults in the U.S. between the ages of 18-25 ($N = 400$; age: $M = 22.42$, $SD = 1.97$) who self-identified as LGBTQ+

Ethnicity		Gender Identity	
Latino/Hispanic	67 (16.8%)	Cisgender woman	215 (53.8%)
Non-Latino/non-Hispanic	331 (82.8%)	Cisgender man	88 (22.0%)
		Transgender woman	18 (4.5%)
		Transgender man	27 (6.8%)
		Non-binary	68 (17.0%)
		Prefer not to say	1 (0.3%)
		Other	10 (2.5%)
Race		Sexual Orientation	
White or European American	249 (62.3%)	Lesbian/Gay	88 (22.0%)
Black or African American	54 (13.5%)	Bisexual	236 (59.0%)
Hispanic or Latinx	45 (11.3%)	Questioning	20 (5.0%)
American Indian or Alaska	4 (1.0%)	Heterosexual	14 (3.5%)
Asian or Asian American	27 (6.8%)	Asexual	40 (10.0%)
Multiracial	21 (5.3%)	Prefer not to say	1 (0.3%)
		Other	44 (11.0%)

- Measures:** Participants completed an ad-hoc online survey through Prolific that included Likert-type and open response items assessing:
 - their social media use
 - perceptions of general toxicity on different platforms
 - perceptions of toxicity directed toward LGBTQ+ individuals on different platforms
 - beliefs about measures to reduce such online toxicity on social media

QUANTITATIVE RESULTS

- YouTube was the platform most regularly-used within the sample (86.3% of respondents), followed by Instagram (73.5% of respondents), TikTok (66.3% of respondents), Twitter (64.3% of respondents), and Reddit (61.8% of respondents).
- Among regular users of the respective platforms, Twitter, TikTok, Reddit, and Facebook were perceived as containing the highest levels of general toxicity.
- Facebook, Twitter, and Reddit were rated as containing the the highest levels of toxicity directed specifically at LGBTQ+ individuals.

- Proportionally, Instagram, Twitter, YouTube, and TikTok were perceived as containing more LGBTQ+-specific toxicity than toxicity, in general.

- The exclusion of transgender individuals, deliberate misuse of preferred pronouns, and homophobia based on religious beliefs were the most common forms of LGBTQ+-specific toxicity reported.

General Social Media Use

Perceptions of General/LGBTQ+ Specific Toxicity

Toxicity Reduction Beliefs

Of the following social media platforms, how much general toxicity would you say exists? (1 is not toxic at all and 7 is very toxic)

Platform	1	2	3	4	5	6	7	not applicable
Instagram	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Twitter	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Reddit	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
YouTube	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
TikTok	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Facebook	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Snapchat	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Of the following social media platforms, how much toxicity to the LGBTQ+ community would you say exists?

When using social media, how often are you in or searching for LGBTQ+ specific spaces and content?

Never or almost never
 Sometimes
 Often
 Most of the time
 Almost always

How have you seen online toxicity towards the LGBTQ+ community within LGBTQ+ spaces dealt with?

How have you seen online toxicity towards the LGBTQ+ community outside of LGBTQ+ spaces dealt with?

QUALITATIVE RESULTS

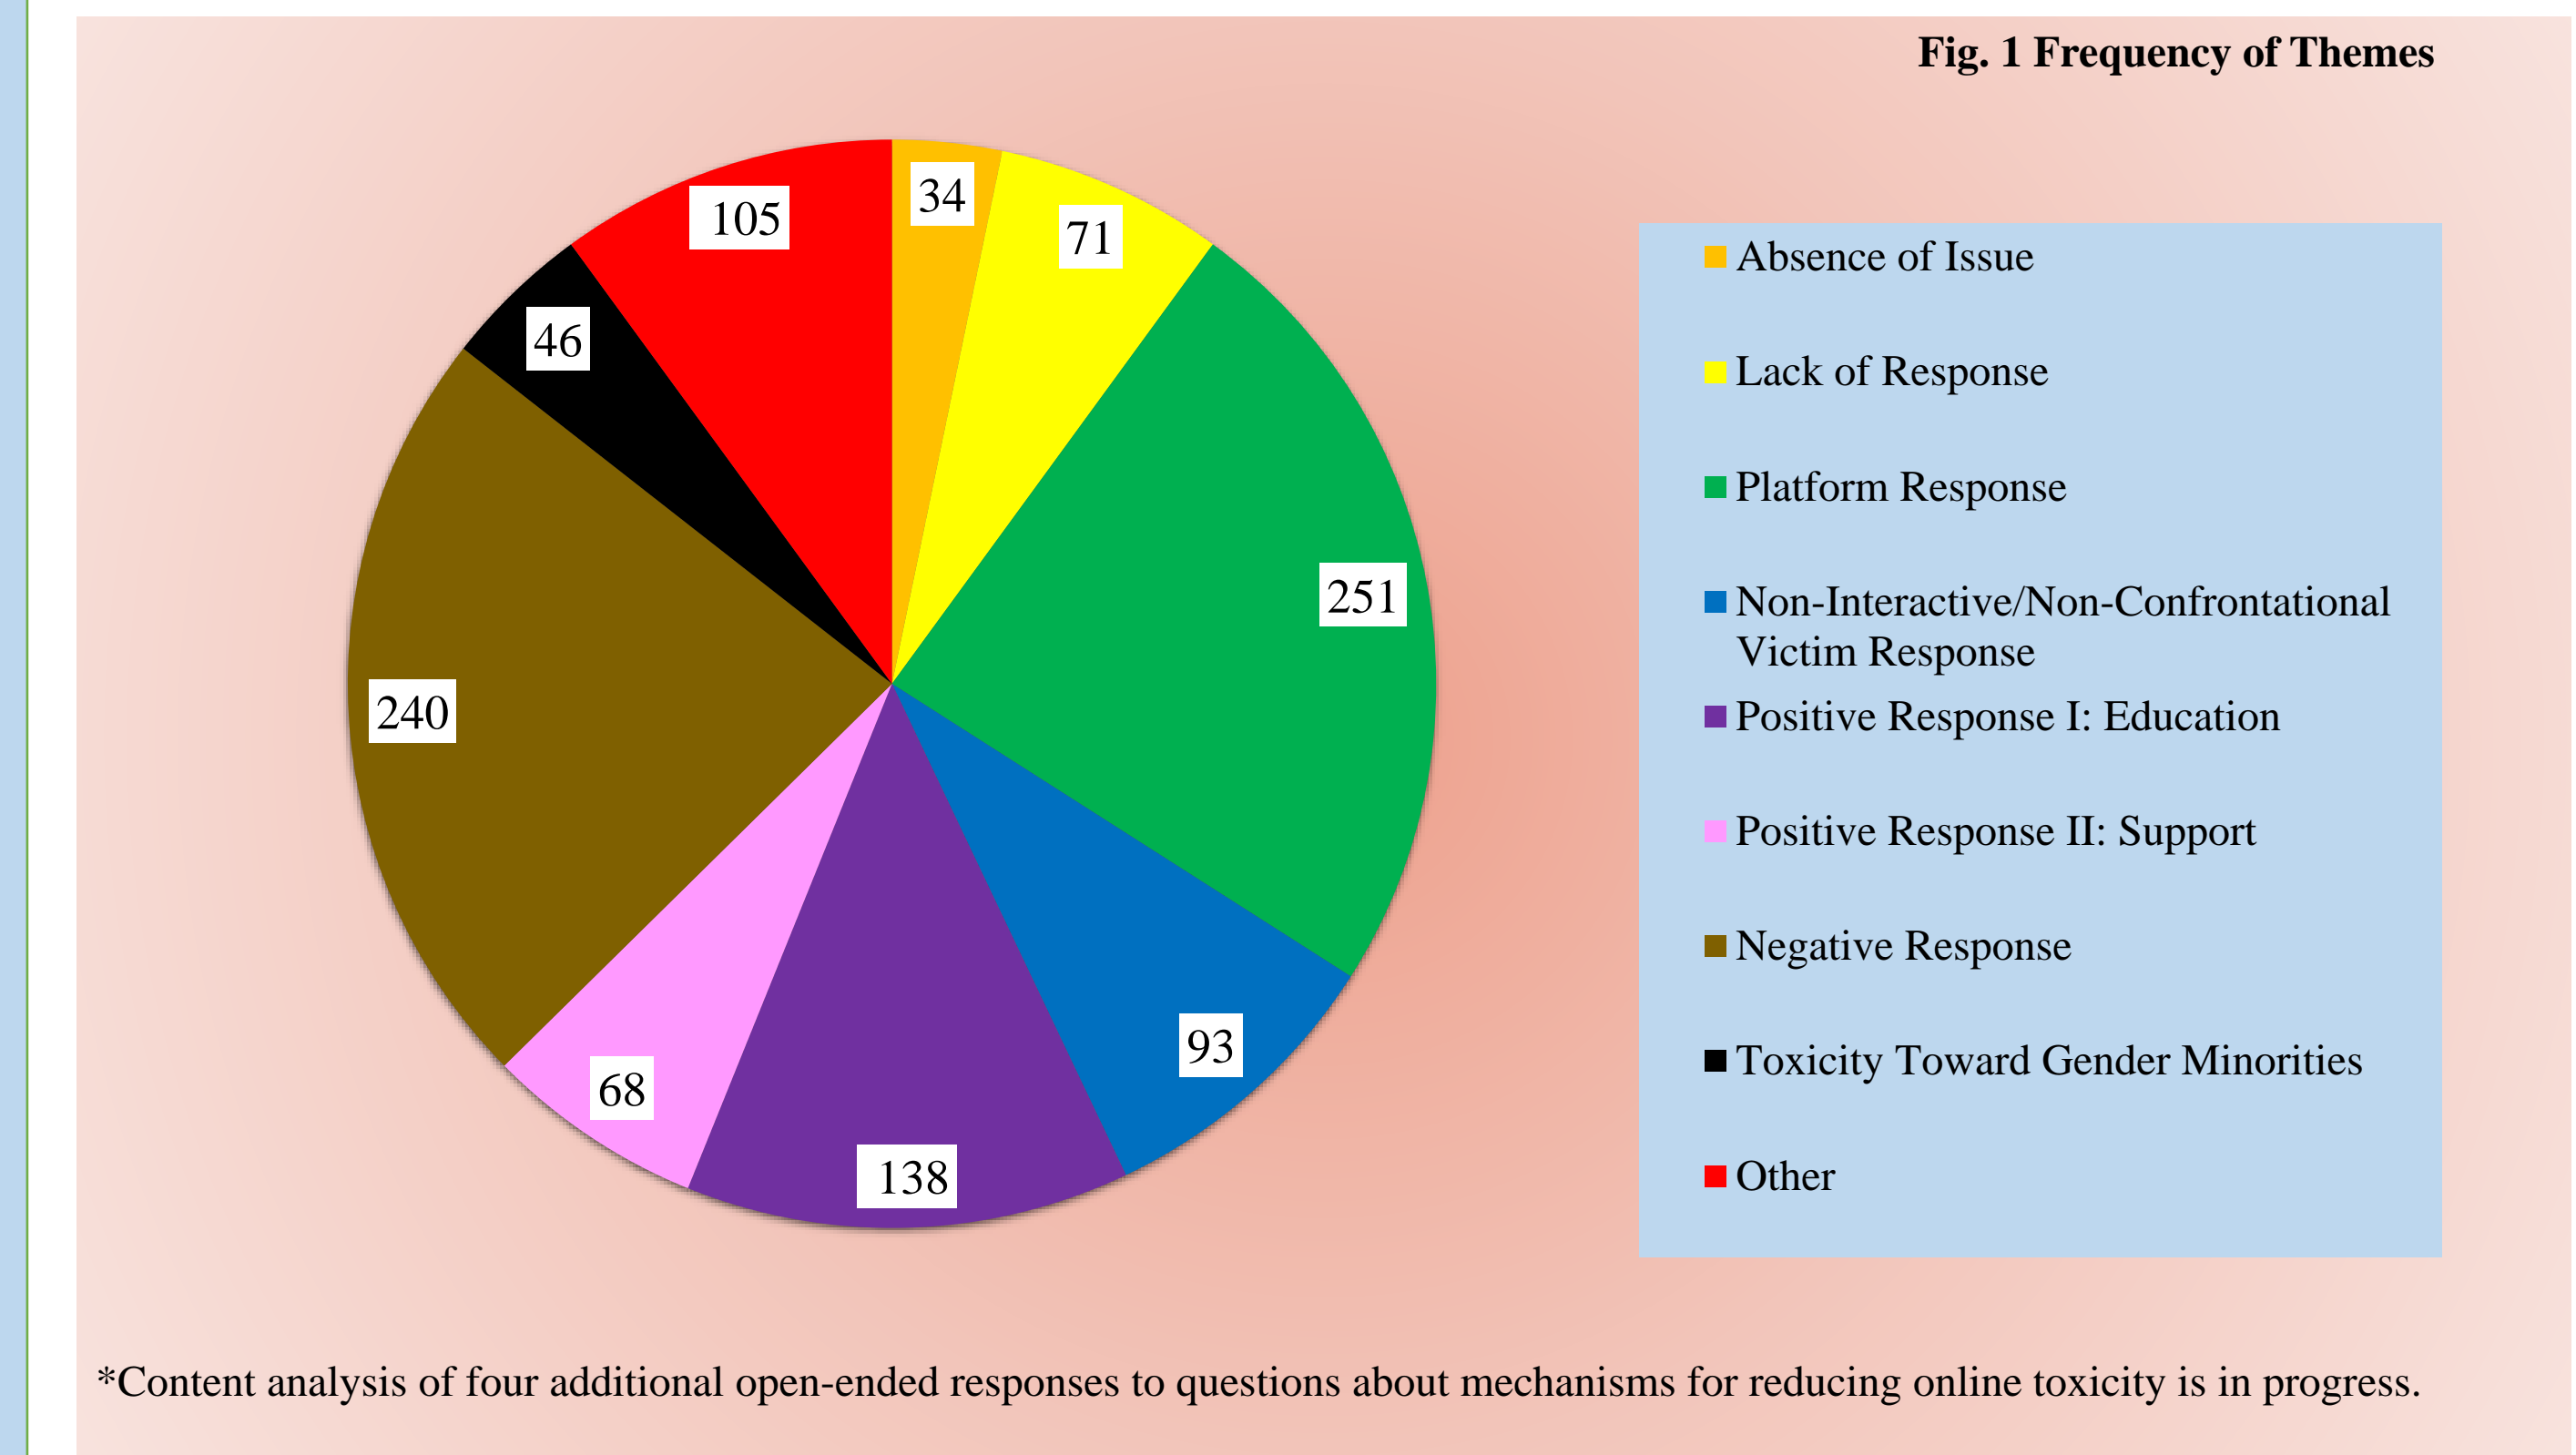

How have you seen online toxicity towards the LGBTQ+ community within LGBTQ+ spaces dealt with?

- A total of $n = 160$ participants provided open-ended responses to this question
- 5 coders reviewed a subset of responses to develop an initial list of themes
- Each response was then independently coded by 2 research team members, with discrepancies resolved by a 3rd team member

Identified Themes:

- Absence of Issue
- Complete Lack of Response (Toxicity occurs but is not handled at all.)
- Platform Response (e.g., users are reported and banned; posts are deleted by moderators; rules are created/enforced and communicated by moderators)
- Non-Interactive/Non-Confrontational Victim Response (e.g., victim of toxicity deletes message and/or blocks toxic user, but does not interact with others in doing so)
- Positive Response #1: Education (Victim/bystanders adopt positive approach by seeking to educate toxic users/others.)
- Positive Response #2: Community Support (Community bands together to support victim; individuals express support for victim)
- Negative Response #1: Attack Perpetrators (Victim/Bystanders' responses have a negative valence; e.g., "calling out" or canceling/ostracizing toxic user, attacking toxic user, doxing/seeking to impact toxic user's personal life)
- Toxicity Toward Gender Minorities (Toxicity specifically targeting trans, non-binary, etc. users.)
- Other (A response that doesn't fit into one of the themes above but could be beneficial to investigate further.)

Fig. 1 Frequency of Themes

*Content analysis of four additional open-ended responses to questions about mechanisms for reducing online toxicity is in progress.

CONCLUSIONS

Study References & LGBTQ+ Resources

- The present study sheds light on the social media experiences of LGBTQ+ individuals as well as potential recommendations for improving these experiences for members of these marginalized communities.

- Strengths:** Sufficiently large sample ($N = 400$), recruitment of participants from an online survey platform that is more demographically diverse than undergraduate participant pools, and a sample comprised exclusively of individuals who identify as a gender or sexual minority.
- Limitations:** Overall lack of diversity with respect to nationality (all U.S. participants) and ethnic and racial identity (e.g., 62.3% of the sample identified as White or European American). Further, 75.8% of the sample identified as Cisgender, with only 11.3% of respondents identifying as Transgender and 17% as Nonbinary.
